e.g. Assaying a human endogenous protein (e.g. IgE, nerve growth factor, insulin or adenosine deaminase or myoglobin), useful for diagnosing asthma or diabetes, by employing an ELISA on a saliva sample from a patient.

Claim 7; Page 4; 24pp; English.

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTNF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin B (IgB), nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgB levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid

```
ö
arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, Addison's disease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires clotting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins serum requires a more complicated sandwich type ELISA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lethal toxin neutralising factor; LTNF; serum protein; immunoglobulin E; IgE; nerve growth factor; NGF; insulin; myoglobin; adenosine deaminase; ADA; asthma; diabetes; autoimmune disease; systemic lupus erythematosus; SLE; rheumatoid arthritis; Sjogren's syndrome; Reiter's syndrome; Graves' disease; Addison's disease; Hodgkin's disease; depression; saliva; ELISA.

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTNF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (IgE), nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Garaves' disease, Addison's disease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by

It is a Lethal Toxin Neutralising Factor (LTNF) moiety from a 68 kDa anti-haemorrhagic protein derived from an opossum. The peptide can be used in a method for treating a victim of envenometion from a poisonous snake, preferably a poisonous snake from the family of Blapidee, Viperidae or sea snake. It is useful for the treatment of snake bites, sepsis, allergies caused by the environment and treatment of be or scorpion stings or toxicities caused by plant or bacterial toxins. The peptide can also be used in histamine reaction treatment. The peptide can be used in envenomation treatment for a variety of snakes without prior identification of the snake. Being short it can be synthetically prepared rather than the current production in horses, where some people can show hypersensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LTNF; lethal toxin neutralising factor; opossum; envenomation; therapy; anti-haemorrhagic protein; Elapidae; Viperidae; sea snake; snake bite; sepsis; allergy; bee sting; scorpion sting; plant toxin; bacterial toxin;
performing an enzyme-linked immunosorbent assay (ELISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires clotting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins serum requires a more complicated sandwich type ELISA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lethal Toxin Neutralising Factor peptide from opossum - can neutralise venom(s) from all major families of poisonous snakes.

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTME) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (1gE), insure growth factor (NGF), insulin, myoglobin and/or adenosinase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifugation to separate serum. Saliva proteins

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTMF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin & [1g5], nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (AbA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLB), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease. Addisease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva callection is relatively non-invasive when compared to blood collection of serum. Saliva can be centrifuged immediately, whereas blood requires
                                                                                                                                                                                                                                                                                       Lethal toxin neutralising factor; LTNF; serum protein; immunoglobulin E; IgE; nerve growth factor; NGF; insulin; myoglobin; adenosine deaminase; AbA; asthma; diabetes; autoimmune disease; systemic lupus erythematosus; SLE; rheumatoid archritis; Sjogren's syndrome; Reiter's syndrome; Graves' disease; Addison's disease; Hodgkin's disease; depression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               clotting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins from serum requires a more complicated sandwich type ELISA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assaying a human endogenous protein (e.g. IgE, nerve growth factor, insulin or adenosine deaminase or myoglobin), useful for diagnosing asthma or diabetes, by employing an ELISA on a saliva sample from a

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTMP) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (IgE), insurin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLB), rheumatoid arthritis, Sjogran's syndrome, Reiter's syndrome, Graves' disease, Addison's disease, attoimmune an endorman and an endorman perfection or the protein may be monitored by assaying a human endogenous protein by performing an enti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires collecting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple BLISA test, whereas an assay of proteins from a be assayed by a simple BLISA test, whereas an assay of proteins from requires a more complicated sandwich type BLISA

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention

                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel human cancer-related genes and proteins (ABZ7810-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humaral or cellular immune response. The genes are useful a probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                 proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in

The genes and proteins are useful for eliciting a humonal or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
             The genes are useful as probes and primers for cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or thair fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                                                                                                                     Gaps
proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78186) and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising a substance that modulates the structure of proteins and polynuclectides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.

                                                                                                                                                                                                                                                                                                                           proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                             The present invention relates to novel human cancer-related genes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                            Hubert RS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

Patent No. 6639050

GENERAL INFORMATION:
APPLICANT: K. Aleliszewski, Marcia
TITLE OF INVENTION: Synthetic Genes for Plant Gums and Other Hydroxyproline-Rich
TITLE OF INVENTION: Glycoproteins
FILE REFERENCE: OHU-04089
CURRENT APPLICATION NUMBER: US/09/547,693
CURRENT FILING DATE: 2000-04-12
NUMBER OF SEQ ID NOS: 236
SOFTWARE: Patentin version 3.0
SEQ ID NO 168
LENGTH: 8
                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Agiotensin-converting enzyme inhibitor (FLP-1) - common fig
NyAlternate names: ficus latex peptide 1
(Species: Picus carica (common fig)
C)Species: Picus carica (common fig)
C)Bate: 07-Una-1990 #sequence_revision 07-Jun-1990 #text_change 08-Dec-1995
C)Accession: PQ0008
R;Maruyama, S: Miyoshi, S: Tanaka, H.
Agric. Biol. Chem. 53, 2763-2767, 1989
A;Title: Angiotensin I-converting enzyme inhibitors derived from Ficus carica.
A;Reference number: PQ0008
A;Accession: PQ0008
A;Molecule type: protein
A;Respecimental source: latex
C;Keywords: angiotensin-converting enzyme inhibitor
|Species: Ctenopharyngodon idella (grass carp)
|Date: 14-Apr-1998 #sequence_revision 24-Apr-1998 #text_change 09-Jul-2004

-I- FUNCTION: One of the primary rRNA binding proteins, it binds
directly to 16S rRNA where it nucleates assembly of the head
domain of the 30S subunit. Is located at the subunit interface
close to the decoding center, probably blocks exit of the B-site
tRNA (By similarity).
-I- SUBUNIT: Part of the 30S ribosomal subunit. Contacts proteins S9
and S11 (By similarity).
-I- SIMILARITY: Belongs to the ribosomal protein S7P family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE, FUNCTION, MASS SPECTROMETRY, AND AMIDATION.

WPI; 2003-636703/60.

e.g. Assaying a human endogenous protein (e.g. IgE, nerve growth factor, insulin or adenosine deaminase or myoglobin), useful for diagnosing asthma or diabetes, by employing an ELISA on a saliva sample from a patient.

Claim 7; Page 4; 24pp; English.

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTNF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin B (IgE), nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the peptide of the invention. It is a Lethal Toxin Neutraliaing Factor (LTNR) moiety from a 68 kDa anti-haemorrhagic protein derived from an opossum. The peptide can be used in a method for treating a victim of envenomation from a poisonous snake, preferably a poisonous snake from the family of Blapidae, Viperidae or sea snake. It is useful for the treatment of snake bites, sepsis, allergies caused by the environment and treatment of be or scorpion stings or toxicities caused by plant or bacterial toxins. The peptide can also be used in histamine reaction treatment. The peptide can be used in envenomation treatment for a variety of snakes without prior identification of the snake. Being short it can be synthetically prepared rather than the current production in horses, where some people can show hypersensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LTNF; lethal toxin neutralising factor; opossum; envenomation; therapy; anti-haemorrhagic protein; Elapidae; Viperidae; sea snake; snake bite; sepsis; allergy; bee sting; scorpion sting; plant toxin; bacterial toxin;
arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, Addison's disease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (BLISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires clotting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins serum requires a more complicated sandwich type ELISA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lethal Toxin Neutralising Factor peptide from opossum - can neutralise venom(s) from all major families of poisonous snakes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTMP) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (1gE), nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IGE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, Addison's disease or Hödgin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires collecting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins can be assayed by a simple ELISA test, whereas an assay of proteins from requires a more complicated sandwich type ELISA

reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                       New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides AAW45983-W456025 are based on portions of somatostatin, somatostatin receptors (SSTR) and insulin-like growth factor binding proteins (IGFBP). They are capable of increasing weight gain, birth weight, growth rates, milk production, levels of circulating insulin, IGF-I and IGF-III, fibre production and muscle weight. They may be used to modulate carbohydrate metabolism and in treatment of diabetes. The oil carrier may be used for delivery of the peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New non-naturally occurring peptide(s) - which are based on portions of somatostatin, somatostatin receptors and insulin-like growth factor binding protein.

```
The present sequence represents a mutated portion of an integrase. The specification describes a method for targeting integration of retrotransposon of Tyl-copia group to desired location on a chromosome. The method uses a modified integrase in a retrotransposon, where the modified integrase contains a coding sequence for a peptide portion which specifically binds to protein bound to the chromosome or to particular nucleic acid sequences on chromosome. The method is useful for targeting integration of a retrotransposon of the Tyl-copia group to a desired chromatin targeting of Ty5 is useful for tagging genes which are affected by aging and for studying oncogenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 epitope. The invention relates to a novel method for designing degenerate PCR primers (AAZ30975-Z31000, AAZ32601- AAZ32611) for amplifying target polynucleotides. This method comprises identifying uniquely conserved amino acid sequences (e.g, this epitope) in target proteins; synthesising degenerate polynucleotides encoding the conserved sequences; and substituting the synthesised polynucleotides with up to four predetermined nucleotides (e.g., inosine) at degenerate nucleotide positions. The nucleic acids comprise no more than 7 degenerate positions, have no more than 2 adjacent predetermined nucleotides and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a conserved Coxsackievirus A (serotype A16) VP1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Virus; epitope; target; degenerate; PCR; primer; amplification; VP1;

                                                                                                                                                                                                                                                                                                                         A peptide of 5-25 amino acid residues (pref. one of the pentapeptides AAR37031-3 or an atriopeptin e.g. atriopeptin A or D, see AAR37337-8) having an activated carboxyl group capable of forming a betaglycosylamine linked glycoconjugate is reacted with an unprotected betaglycosylamine deriv. of an oligosaccharide. The deriv. is prepared by reacting an unprotected oligosaccharide the deriv. is prepared by with saturated ammonium bicarbonate at pH 80-8.5. The N-linked glycoconjugate is produced under conditions to directly maintain the beta-anomeric configuration. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Targeting integration of retrotransposon or retrovirus into silent chromatin by transforming a cell with modified integrase having a coding sequence for a peptide portion that interacts with chromatin at desired
                                                                                                                                                                                      N-linked peptide glyco-conjugate(s) prepn. - by reacting oligosaccharide(s) with ammonium bi:carbonate to maintain beta-anomeric configuration, and avoid sepn. of anomers.

predetermined nucleotides are 3 bases away from the 3' end of the synthesised strand. The degenerate primers are useful for amplifying target polynucleotides by the polywerses chain reaction (PCR). The use of the method of designing degenerate primers useful for the detection of polioviruses in clinical samples is described in USS85477. The degenerate primers facilitate PCR amplification of unknown polynucleotides, where the amino acid sequence encoded is known. The primers also allow for the subsequent molecular based diagnosis with a serologically derived diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method of screening for a compound that modulates the binding of an oligosaccharide to a beta subunit of AMP kinase. The method comprises: (1) exposing a candidate compound to an oligosaccharide and a polypeptide comprising a beta subunit of AMP kinase, or its mutant and/or fragment that binds an oligosaccharide; and C12 assessing the ability of the candidate compound to modulate binding of the polypeptide to the oligosaccharide. An AMP kinase beta subunit oligosaccharide binding domain sequence has antidiabbetic, cytostatic, antiarteriosclerotic and anorectic activities, and can be used in gene therapy. The method is useful for screening for a compound that modulates the binding of an oligosaccharide to a beta subunit of AMP kinase for treating or preventing a condition associated with AMP kinase activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for a compound that modulates the binding of an oligosaccharide to a beta subunit of AMP kinase by assessing the ability of the candidate compound to modulate binding of the polypeptide to the oligosaccharide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel polypeptide encoded by an alternative
                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes an antibody which specifically recognises the human VPLF (vascular endothelial growth factor (VBGF)/plateletactive derived growth factor (PBGF)/plateletactive of this protein as growth factor. The antibody has vasotropic, vulnerary, nephrotropic, cardiant, antidiabetic, antiarteriosclerotic, antianaemic, osteopathic, anticheumatic, antiarthritic and antipsoriatic activities. The antibody is applicable in diagnostics and remedias for VPLF-participated diseases like arthritis, ischaemic diseases and retarded wound healing. The present sequence represents a human VPLF related peptide sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Etiological agent; autoimmune disease; systemic lupus erythematosus; SLE; Ro/SSA; immunoreactive; autoantibody; antigenicity; nucleocapsid;
                                                                                                                                                                                                                          Antibody specifically recognizing VPLF or its variant and inhibiting its activity, applicable in diagnostics and remedies for VPLF-participating diseases like arthritis, ischemic diseases and retarded wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determination of immunogenic agent in auto-immune disease - by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence sequence is provided in a specification relating to a novel vascular endothelial growth factor (VBGF)/platelet derived growth factor (VBGF)/platelet derived growth factor (PBGF)-like factor of 345 amino acids, or to a sequence in which at least one amino acid is deleted, replaced or added compared to the native sequence. The nucleotide sequence encoding the VBGF/PDGF-like factor may be integrated into a vector and used to transform a host cell. The VBGF/PDGF-like factor may be used in the development of agents for transform of a section treating diseases associated with abnormal neovascularisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; VPLF; VEGF/PDGF-like factor; vascular endothelial growth factor; platelet-derived growth factor; antibody; inhibition; growth factor; vasctropic; variation ential antidatetic; antianaemic; antidateticsclerotic; osteopathic; antirheumatic; antianthritic; antipsoriatic; arthritis; ischaemic disease; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New VEGF/PDGF-like factor useful for the development of treating agents for diseases accompanied by accentuation of abnormal neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to methods to determine the etiological agent of autoimmune diseases such as systemic lupus erythematosus (SLB). A common antigen for SLE and closely related disorders is the 60 kD protein-RNA particle: Ro/SSA, present in all cells studied to date. Staphylococcus VB protease digestion of this protein reveals bands of 51, 40, 35, 28 and 13 kD which are strongly immunoreactive with SLE autoantibodies. From the 13 kD band, peptide AAWA-911 demonstrated maximal antigenicity against anti-Ro/SSA autoantibodies beptides immunoreactive with SLE autoantibodies can then be used to screen for other peptides reactive with the antibodies. An example of such a peptide is the sequence presented here which is derived from the nucleocapsid protein of the Indiana serotype of the vesicular stomatitis virus. (Updated on 25-MAR-2003 to correct PP

The nucleotide sequence encoding the VEGF/PDGF-like factor may be integrated into a vector and used to transform a host cell. The VEGF/PDGF-like factor may be used in the development of agents for treating diseases associated with abnormal neovascularisation. The present sequence is the N-terminal sequence of the protein shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New VEGF/PDGF-like factor useful for the development of treating agents for diseases accompanied by accentuation of abnormal neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
identifying protein sequences homologous to self-antigen sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VEGF/PDGF-like factor; vascular endothelial growth factor; VEGF; platelet derived growth factor; PDGF; neovascularisation; disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an antibody which specifically recognises the human VPLF (vascular endothelial growth factor (VBGF)/plateletderived growth factor (PDGF-like factor) protein, and inhibits the activity of this protein as a growth factor. The antibody has vasotropic, vulnerary, nephrotropic, cardiant, antidiabetic, antiarteriosolerotic, antianaemic, osteopathic, antirheumatic, antiarthritic and antipsoriatic activities. The antibody is applicable in diagnostics and remedies for VPLF-participated diseases like arthritis, ischaemic diseases and retarded wound healing. The present sequence represents a human VPLF related peptide sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                    platelet-derived growth factor; antibody; inhibition; growth factor; vasotropic; valnerary; nephrotropic; cardiant; antidiabetic; antianaemic; antiarteriosclerotic; osteopathic; antirheumatic; antiarthritic; antipsoriatic; arthritis; ischemic disease; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody specifically recognizing VPLF or its variant and inhibiting its activity, applicable in diagnostics and remedies for VPLF-participating diseases like arthritis, ischemic diseases and retarded wound healing.
